## Transperineal Access System

The PrecisionPoint™ Transperineal Access System revolutionizes the methodology for obtaining prostate biopsies. This medical system takes full advantage of the transperineal path to more thoroughly sample all regions of the prostate including those difficult to access with the transrectal approach. Since the technique is free hand, the practitioner can easily target the desired locations with certainty and through a single puncture of the skin.

In addition, the PrecisionPoint™ minimizes the potential for infection, since passage of the biopsy needle avoids the rectal wall contaminants entirely.

For the patient, this means no bowel prep or need to pre-medicate with antibiotics. The PrecisionPoint™ enables the practitioner to perform the biopsy under local anesthesia in a short duration procedure.
